"The Logic of Chance", subtitled "The Nature and Origin of Biological Evolution", is a delightful introduction to the current understanding of the natural evolution. The book is written in such a way that it allows the passionate layperson to follow and understand the presentation, with just the right amount of effort in order to provide satisfaction without (too much) frustration. The author, who is a respected researcher in evolutionary and computational biology, does not limit himself to ...

Fascinating, But Flawed, Argument Emphasizing Biological Evolution's Stochastic Nature Having heard Eugene Koonin speak on the origins of eukaryotes at Rockefeller University back in May, 2008, I had high expectations for this book. In "The Logic of Chance: The Nature and Origin of Biological Evolution", Koonin argues that biological evolution is a "stochastic process based on historical contingency, constrained by requirements for maintaining cell organization and modulated by ...

In this ambitious book, Eugene V. Koonin illuminates the gamut of randomness and regularity that is at the heart of life. Pointing the way beyond Modern Synthesis, Koonin brings together new data and concepts in an attempt to achieve a far deeper understanding of the interplay between chance and necessity that drives biological evolution. He explains evolution as a stochastic process based on historical contingency, constrained by requirements for maintaining cell organization and modulated ...

The Logic of Chance. The Nature and Origin of Biological Evolution. Pearson, FT Press hardback 516 pp. In this review I focus on a spectacular claim in chapter 12 and Appendix B that sets it apart from the rest of the book and from the opinion of almost every evolutionary biologist. For this review I ignore the rest of the book. So this is not a review of the book (impossible anyway). In ...

Devolution, de-evolution, or backward evolution is the notion that species can revert to supposedly more primitive forms over time. The concept relates to the idea that evolution has a purpose (teleology) and is progressive (orthogenesis), for example that feet might be better than hooves or lungs than gills. However, evolutionary biology makes no such assumptions, and natural selection shapes ...

Synopsis. In his book On the Origin of Species, Charles Darwin meticulously collected evidence of temporal change that permeates the world of living beings and proposed for the first time a plausible mechanism of evolution: natural selection. Evolution by natural selection certainly is one of the most consequential concepts ever developed by a scientist and even has been deemed the single most ...
